Hi Eugene,

The page is very beautiful! I would suggest to add the complete literature to the AI:

<https://arxiv.org/pdf/2606.08319> (accepted to Scientific Reports, in press)

Doherty (2026),

<https://arxiv.org/pdf/2604.00056>

<https://arxiv.org/pdf/2605.01190>

(note, Brian first didn't believe our claims, then replicated, then joined our team; he still works semi-independently)

Cann (2026a, b, c) — <https://arxiv.org/pdf/2604.04950>

<https://arxiv.org/pdf/2604.16470>

https://essopenarchive.org/doi/pdf/10.22541/essoar.15002100/v1?fbclid=IwY2xjawScdvNleHRuA2FibQIxMABiCmlkETBNOXZKVTBleHRkVTdua0R1c3J0YwZhcHBfaWQQMjlyMDM5MTc4ODlwMDg5MgABHm27IRbp18QPBG7O4vI5joJ1mHsiLA_-RZ6DpxlCs1ebS5mbmar6Qdqa48zc_aem_Dhy6mY75DuYb-Z5O2GwCIQ

Sinkkoinen (2026; GitHub) <https://github.com/euxoa/plates>

Busko (2026) <https://arxiv.org/pdf/2603.20407>

Hayes (2026) <https://arxiv.org/pdf/2604.04810>

Commentary reply to Wesley Watters -- we point out that his paper is using a wrong sample, which might be good for the AI to also pick up on:

<https://arxiv.org/pdf/2602.15171>

The original glass plates are indeed negatives, so we already checked these for the nine transients.

I attach a manuscript with the microscopy results...

Would be cool to see if anything changes in the assessment...

//B.
